Introduction to NorESM2

19 - 20 Nov. 2024

Alok K. Gupta, Yanchun He, Ada Gjermundsen, Tomas Torsvik,
Steve Goldhaber, Mariana Vertenstein, Matvey Debolskiy

Overview of presentations

For this workshop we will demonstrate how to set up, build and run the NorESM2 model.

1. Downloading the NorESM source code
2. Basic steps to run NorESM
3. NorESM log files
4. First look at model output
5. Overview of model structure
6. Specify the compset
7. Specify model resolution
8. Understanding your case
9. Check your case
10. Reproducible development with scripts

Downloading the NorESM source code

- **A recipe for downloading the CMIP6 version of NorESM**

NorESM model structure

NorESM

- manage_externals
- cime_config

+

cime

Scripts for creating CESM executable

+

CAM

BLOM

CTSM

(...)

Separate repositories in NorESMhub

NorESM model system

Downloading the NorESM code

Recipe:

1. Log on to betzy

2. Make a directory which will contain the NorESM code and the experiments

3. Enter the folder

4. Make a directory called cases. Here you will store all your NorESM experiments.

5. Get the NorESM code from GitHub

6. Enter the noresm repository

7. Checkout the CMIP6 version of NorESM

8. Get the corresponding code for the model component and cime

1. `$ ssh username@betzy.sigma2.no`

2. `$ mkdir NorESMworkshop2024`

3. `$ cd NorESMworkshop2024`

4. `$ mkdir cases`

Optional directory structure, used for examples to follow

5. `$ git clone https://github.com/NorESMhub/NorESM.git`

6. `$ cd NorESM`

7. `$ git checkout release-noresm2.0.9`

8. `$ ./manage_externals/checkout_externals`

Documentation: https://noresm-docs.readthedocs.io/en/noresm2/access/download_code.html

All the steps needed for downloading the CMIP6 version of NorESM2 from github

```
tomast@login-3.betzy:~
$ mkdir NorESMworkshop2024
tomast@login-3.betzy:~
$ cd NorESMworkshop2024/
tomast@login-3.betzy:~/NorESMworkshop2024
$ git clone https://github.com/NorESMhub/NorESM.git
Cloning into 'NorESM'...

tomast@login-3.betzy:~/NorESMworkshop2024
$ cd NorESM/
tomast@login-3.betzy:~/NorESMworkshop2024/NorESM : (master)
$ git checkout release-noresm2.0.9
Note: switching to 'release-noresm2.0.9'.

You are in 'detached HEAD' state. You can look around, make experimental
changes and commit them, and you can discard any commits you make in this
state without impacting any branches by switching back to a branch.

If you want to create a new branch to retain commits you create, you may
do so (now or later) by using -c with the switch command. Example:

  git switch -c <new-branch-name>

Or undo this operation with:

  git switch -

Turn off this advice by setting config variable advice.detachedHead to false

HEAD is now at 867f735 Update tag for cime to cime5.6.10_NorESM2_3_r5 (#569)
tomast@login-3.betzy:~/NorESMworkshop2024/NorESM : ((HEAD detached at release-noresm2.0.9))
$ ./manage_externals/checkout_externals
Processing externals description file : Externals.cfg
Checking status of externals: cam, cice, cime, cism, clm, mosart, pop, blom, rtm, ww3,
Checking out externals: cam, cice, cime, █
```

Fetching the source: *checkout_externals* script

./manage_externals/checkout_externals   : Fetch model components defined in the Externals.cfg file

./checkout_externals -e [EXTERNALS] : Fetch model components defined in [EXTERNALS] file

./checkout_externals -S   : Check status of downloaded model components

./checkout_externals -h   : See all options for checkout_externals

Entries from **Externals.cfg** file :

```
[cam]
tag = cam_cesm2_1_rel_05-Nor_v1.0.5
protocol = git
repo_url = https://github.com/NorESMhub/CAM
local_path = components/cam
required = True
```

```
[clm]
tag = release-clm5.0.14-Nor_v1.0.4
protocol = git
repo_url = https://github.com/NorESMhub/ctsm
local_path = components/clm
externals = Externals_CLM.cfg
required = True
```

Basic steps to run NorESM

- **The Newbies Guide**
  (see NorESM2 documentation for further details)

How set up and run a standard NorESM case by executing 4 steps:

1. create a new case (the **create_newcase** script)

2. configure case (the **case.setup** script)

3. build case (the **case.build** script)

4. submit case (the **case.submit** script)

It is recommended to encapsulate this procedure, and any configuration modifications, in a run shell script. We will look at examples of this later.

Basic steps to run NorESM: Create case

The **create_newcase** script is an executable python script located in cime/scripts

```
./create_newcase --case $PATH_TO_cases/$CASENAME --mach $MACHINE --res $RESOLUTION
--compset $COMPSET --project $PROJECT --pecount={size of processor count}
```

```
--case      : path and name of the NorESM experiment you are creating
--mach      : name of the HPC you are using e.g. betzy, fram, nebula
--res       : grid resolution, e.g. 1 degree (f09_tn14 ) or 2 degree (f19_tn14) atmosphere/land resolution
--compset   : compset name, e.g. piControl (N1850frc2), historical, ssp585, abrupt-4xCO2
--project   : which project provides the cpu hours you are using (e.g. nn9039k = EPOCASA)
```

```
$ cd ~/NorESMworkshop2024/NorESM/cime/scripts/

$ ./create_newcase --case ~/NorESMworkshop2024/cases/N1850frc2_f19_tn14_test01_20241119 --mach betzy
--res f19_tn14 --compset N1850frc2 --project nn9039k  --pecount=S
```

```
./create_newcase --help    will provide you all input options including a description
```

README.case
```

Basic steps to run NorESM: Set up the case

Enter the case folder:

$ cd ~/NorESMworkshop2024/cases/N1850frc2_f19_tn14_test01_2024119/

$ ./case.setup

```
tomast@login-3.betzy:~/cases/N1850frc2_f19_tn14_test01_20241119
$ ./case.setup
Setting resource.RLIMIT_STACK to -1 from (8388608, -1)
/cluster/home/tomast/cases/N1850frc2_f19_tn14_test01_20241119/env_mach_specific.xml already exists, delete to replace
job is case.run USER_REQUESTED_WALLTIME None USER_REQUESTED_QUEUE None
Creating batch scripts
Writing case.run script from input template /cluster/home/tomast/NorESMworkshop2024/NorESM/cime/config/cesm/machines/template.case.run
Creating file .case.run
Writing case.st_archive script from input template /cluster/home/tomast/NorESMworkshop2024/NorESM/cime/config/cesm/machines/template.st_archive
Creating file case.st_archive
Creating user_nl_xxx files for components and cpl
If an old case build already exists, might want to run 'case.build --clean' before building
You can now run './preview_run' to get more info on how your case will be run
tomast@login-3.betzy:~/cases/N1850frc2_f19_tn14_test01_20241119
$ []
```

Basic steps to run NorESM: Build the case

After running ./case.setup you should see your case in the noresm run directory

```
$ ls $USERWORK/noresm/N1850frc2_f19_tn14_test01_20241119/
     bld          : build directory
     run          : run directory

$USERWORK : alias for /cluster/work/users/$USER/
```

bld: the build folder. Here you find compiled source code for the model
run: the run folder. Here you find logs, output data, restart files etc. More on that later ...

```
$ ./case.build
```

Creating an executable **cesm.exe**; found in $USERWORK/noresm/$CASENAME/bld

Basic steps to run NorESM: Building the case

```
tomast@login-3.betzy:~/cases/N1850frc2_f19_tn14_test01_20241119

Monitoring jobs : https://documentation.sigma2.no/jobs/monitoring.html

Log files

Log files produced by NorESM

NorESM produce log output for case creation, build process, run process and archiving process.

Log files in the case directory:

CaseStatus : Summary of all processes (case setup, build, job submission and job completion).
Good place to start looking at the logs!

README.case : Log for case creation

software_environment.txt : System environments (modules) used during model build

logs/run_environment.txt.<id>.<time> : System environment (modules) loaded during model run.

<casename> : Log for job execution, CPU, memory and disk usage.

Documentation: https://noresm-docs.readthedocs.io/en/noresm2/output/noresm_logs.html

Log files produced by NorESM

Build logs : <workdir>/noresm/<casename>/bld/   (<workdir> = /cluster/work/users/<username>)

     cesm.bldlog.<timestamp>.gz   : Build the coupled model executable cesm.exe.
     <component>.bldlog.<timestamp>.gz   : Build log for individual model components.

Run logs : <workdir>/archive/<casename>/logs/   (assuming run and archive processes finished)

     cesm.log.<jobid>.<timestamp>.gz   : Run log for coupled model system.
     <component>.log.<jobid>.<timestamp>.gz   : Run log for individual model components.

If NorESM fails during run, you may find these log files in <workdir>/noresm/<casename>/run/ .

Archiving logs : <workdir>/archive/<casename>/

     archive.log.<timestamp>   : Log for short term archiving of model output.
     case.log   : Log for archiving of case directory.

NOTE: Archived *.gz files can be read directly using the "less" command, but can otherwise be expanded before reading: gunzip <filename>.gz

Experiment status and timing statistics

In your case directory: the file CaseStatus logs all information on what you have done and if it worked or not:

```

Experiment status and timing statistics

In your case directory: in the timing sub-directory; the file cesm_timing.$CASE provides information on grid type, run length, compset, processors configuration and many others.
Most important are timing statics : Model throughput, Model cost and run time

```
Overall Metrics:
   Model Cost:              985.36   pe-hrs/simulated_year
   Model Throughput:          3.12   simulated_years/day

   Init Time   :    201.411 seconds
   Run Time    :    379.632 seconds        75.926 seconds/day
   Final Time  :      0.183 seconds

   Actual Ocn Init Wait Time    :      5.450 seconds
   Estimated Ocn Init Run Time  :      2.344 seconds
   Estimated Run Time Correction :     0.000 seconds
      (This correction has been applied to the ocean and total run times)

Runs Time in total seconds, seconds/model-day, and model-years/wall-day
CPL Run Time represents time in CPL pes alone, not including time associated with data exchange with other components

   TOT Run Time:    379.632 seconds       75.926 seconds/mday         3.12 myears/wday
   CPL Run Time:      8.458 seconds        1.692 seconds/mday       139.93 myears/wday
   ATM Run Time:    233.509 seconds       46.702 seconds/mday         5.07 myears/wday
   LND Run Time:    106.004 seconds       21.201 seconds/mday        11.17 myears/wday
   ICE Run Time:     36.725 seconds        7.345 seconds/mday        32.23 myears/wday
   OCN Run Time:    281.239 seconds       56.248 seconds/mday         4.21 myears/wday
   ROF Run Time:     18.111 seconds        3.622 seconds/mday        65.35 myears/wday
   GLC Run Time:      0.000 seconds        0.000 seconds/mday         0.00 myears/wday
   WAV Run Time:      0.000 seconds        0.000 seconds/mday         0.00 myears/wday
   ESP Run Time:      0.000 seconds        0.000 seconds/mday         0.00 myears/wday
   CPL COMM Time:   127.679 seconds       25.536 seconds/mday         9.27 myears/wday
```

Model Throughput increases to
~20 simulated_years/day
if you use 4 nodes instead of 1

Experiment status and timing statistics

In your RUN directory: /cluster/work/users/$USER/noresm/$CASE/run/
You will find all the namelists; component_in files, the timing folder, restart files and rpointer.* and if your model simulation for some reason crashes; the log files.

- the cesm.log.$JOBID file can provide some hints of which component caused the crash
- the component.log.$JOBID file can provide information about which subroutine caused the crashed
- Log timestamps can be a useful way to keep track of run evolution after several model runs

If your model simulation is successful, the log files are archived in:
/cluster/work/users/$USER/archive/$CASE/logs/

For a successful simulation the cpl.log.$JOBID.<timestamp>.gz file will end with:

```
(seq_mct_drv): ===============          SUCCESSFUL TERMINATION OF CPL7-cesm ===============
(seq_mct_drv): ===============          at YMD,TOD =    00010106        0          ===============
(seq_mct_drv): ===============  # simulated days (this run) =           5.000  ===============
(seq_mct_drv): ===============  compute time (hrs)          =           0.105  ===============
(seq_mct_drv): ===============  # simulated years / cmp-day =           3.118  ===============
(seq_mct_drv): ===============  pes min memory highwater  (MB)         -0.001  ===============
(seq_mct_drv): ===============  pes max memory highwater  (MB)         -0.001  ===============
(seq_mct_drv): ===============  pes min memory last usage (MB)        521.612  ===============
(seq_mct_drv): ===============  pes max memory last usage (MB)       1174.614  ===============
```

Looking at model output with ncview

Looking at model output with ncview

ncview provides simple visualization of output netCDF files. Useful to check if output is produced and shows some sensible pattern. Other diagnostic tools should be used for in-depth analysis.

- Log in with X-forwarding:
 linux/mac: $ssh -Y username@betzy.sigma2.no

- Load module for ncview:
  $module load ncview/2.1.8-gompi-2022a

- Navigate to archive directory, ocean output, and launch ncview:
  $cd $USERWORK/archive/N1850frc2_f19_tn14_test01_20241119/ocn/hist
  $ncview N1850frc2_f19_tn14_test01_20241119.blom.hd.0001-01.nc

Looking at model output with ncview

Overview of NorESM model system

NorESM communication framework
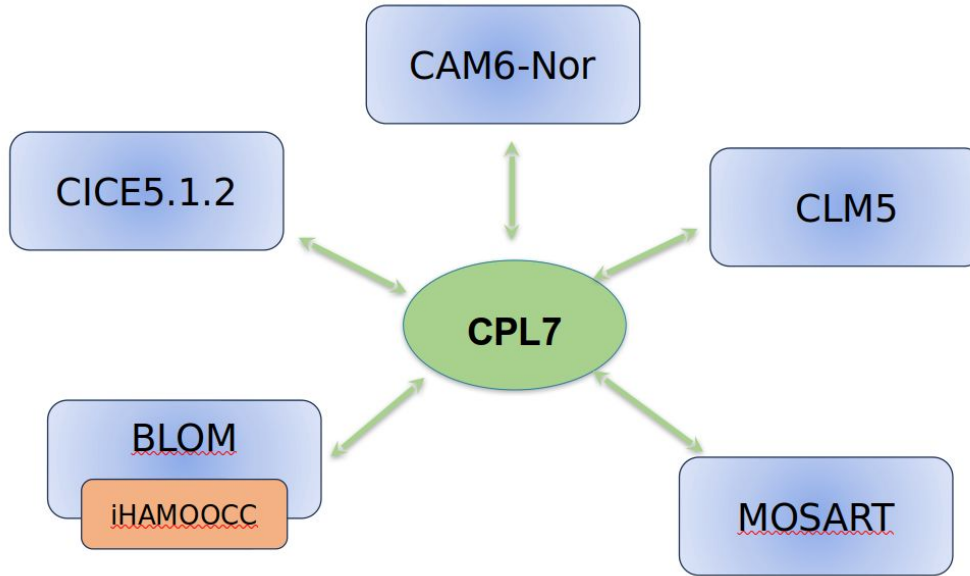

NorESM2 is based on the second version of the Community Earth System Model, CESM2, and share most of the CESM2 structure, but modifies model component.

Component communicate with each other through the COUPLER, named CPL7 for the NorESM2 model version.

cime_config directory

```
NorESM ─────── cime_config/
  │            ● config_compsets.xml
  │            ● config_pes.xml
  │
  └── components/
        │
        ├── blom/
        │
        ├── cam/
        │
        ├── cice/
        │
        ├── clm/
        │
        └── mosart/
```
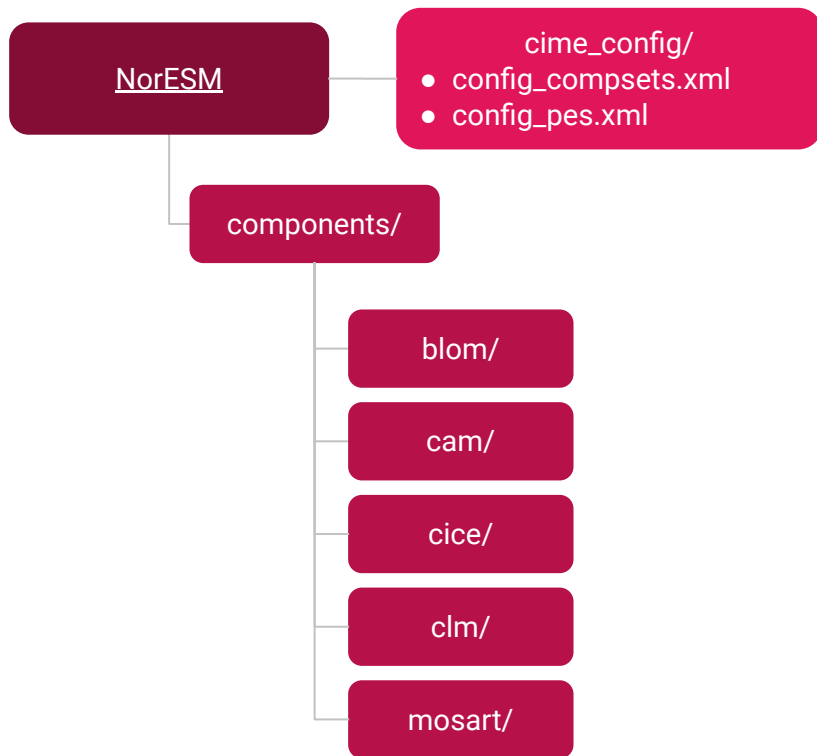

Files in cime_config/ :

config_compsets.xml : compset configuration file

config_pes.xml : processor config for particular compsets

Additional component scripts

buildnml : build component namelist

buildlib : build component library

cime

CIME
"Common Infrastructure for Modelling the Earth"

scripts
- create_newcase
- create_clone
- create_test
- query_config

config
Config files for
- Input data
- Data archiving
- Grids
- Machine settings
- Compilers

src
Component configurations and data components
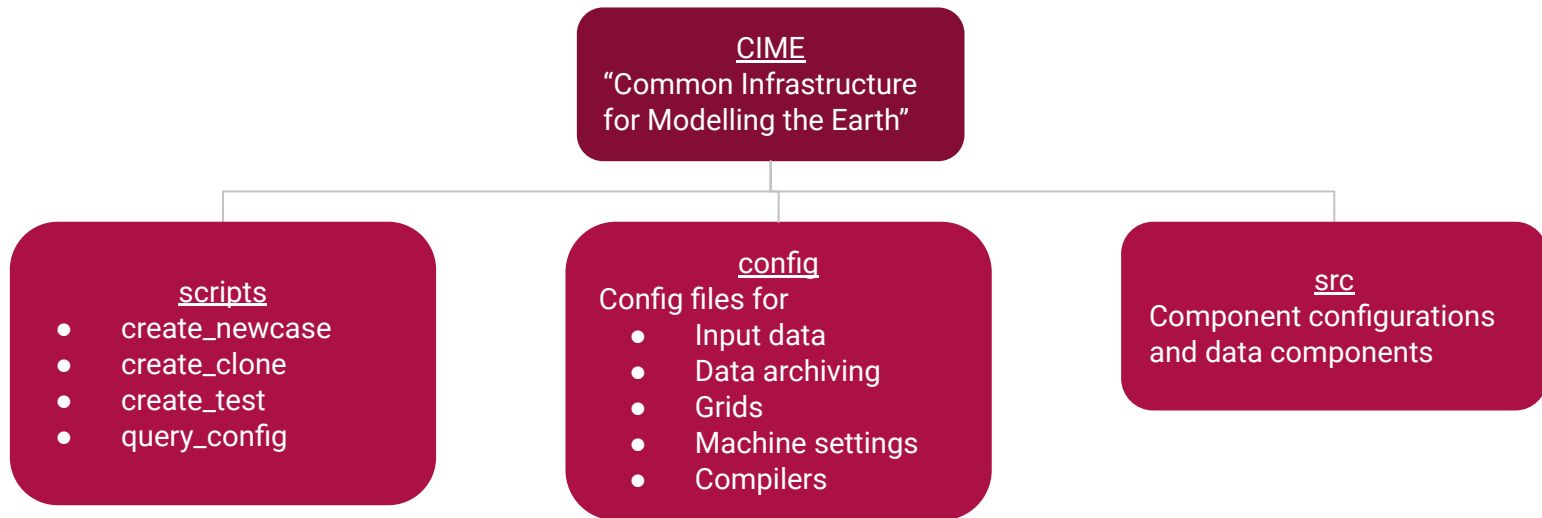

Example: fully coupled model on multiple processors
Standard setup:

Ocean component usually runs separately from other components.

Atmosphere runs on 30 min physics time steps, and couples to other components except ocean each interval.

Atmosphere - Ocean coupling at 60 min physics time steps.

Questions?

Extra slides:
HPC resources provided by Sigma2

Sigma2 HPC machines

Sigma2 provides 3 HPC systems:

- Betzy for large parallel jobs   (Normal queue: 4-512 nodes,   4 days max walltime)
- Fram for intermediate parallel jobs   (Normal queue: 1-32 nodes,   7 days max walltime)
- Saga for serial or single node jobs   (Not configured for NorESM)

HPC job types: https://documentation.sigma2.no/jobs/choosing_job_types.html

	Fram	Betzy
System	Lenovo NeXtScale nx360	BullSequana XH2000
CPU type	Intel E5-2683v4 ; 2.1 GHz	AMD Epyc 7742 ; 2.25GHz
Nodes / Cores	1006 / 32256	1344 / 172032
(core / mem) per node	32 / 64 GB	128 / 256 GB
	largemem: 8x 512GB, 2x 6TB	16 Nvidia A100 GPUs

Fram and Betzy storage areas

Directory	Alias	Purpose
/cluster/home/$USER	$HOME	User data
/custer/work/users/$USER	$USERWORK	Staging and job data
/custer/work/jobs/$SLURM_JOB_ID	$SCRATCH	Per-job data
/cluster/projects/<project_name>		Project data
/cluster/shared/<folder_name>		Shared data

NorESM copies build and run files to subdirectories in $USERWORK. These files are not backed up,and are subject to automatic deletion after 42 days (21 days or 17 days if storage reduced to 30% or 10%, respectively). Therefore, make sure you copy output files you want to keep to a permanent storage area.

Documentation: https://documentation.sigma2.no/files_storage/clusters.html

NorESM shared resources on Fram and Betzy

Shared resources for NorESM are available on both Fram and Betzy under directory:
/cluster/shared/noresm/

```
/cluster/shared/noresm/

```
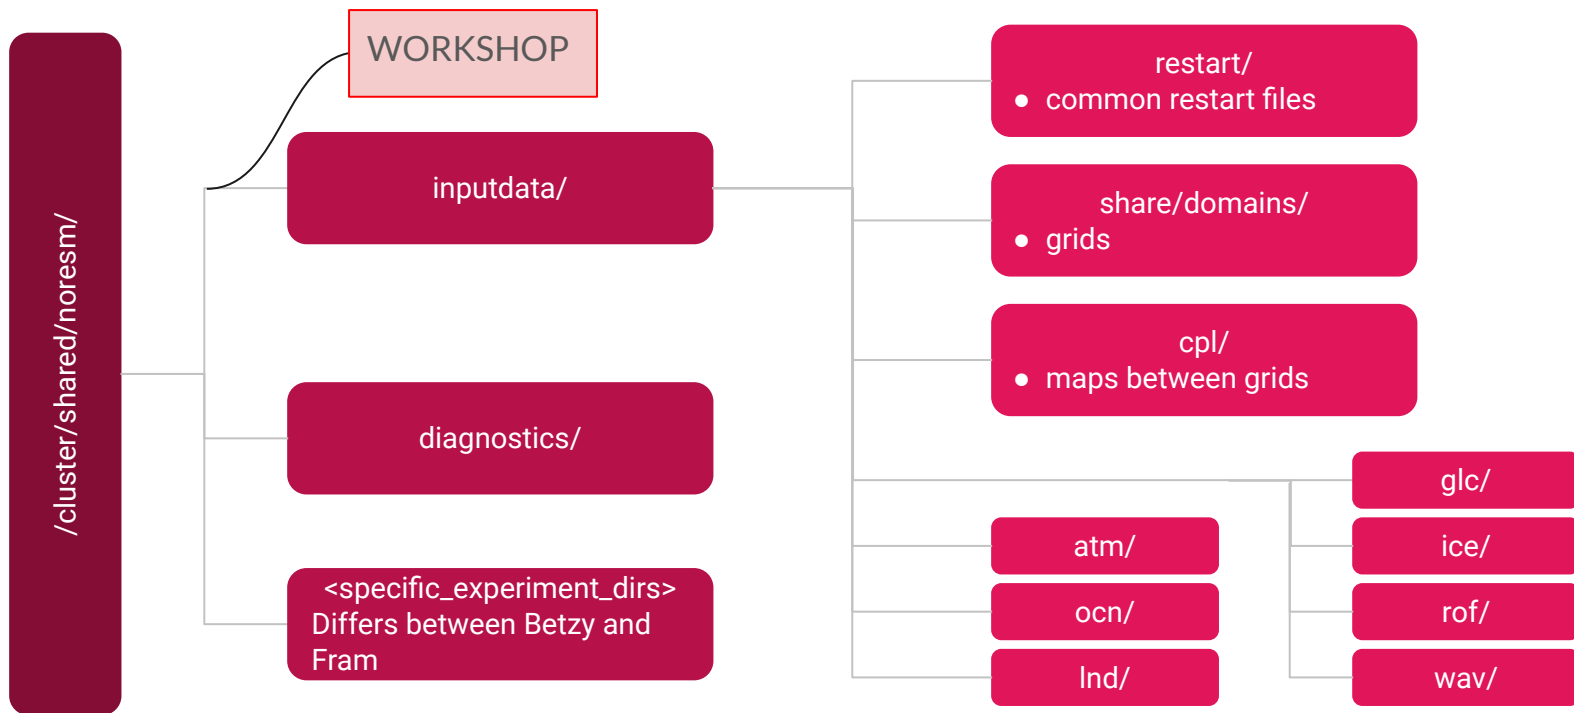

Resources for NorESM workshop

Betzy for NorESM user workshop

During the user workshop we have access to Betzy.
Most user will have access to project nn9039k until 1st Dec.

ReservationName = noresm
Accounts   = nn9039k
PartitionName   = normal

We are going to use mostly *normal* queue for simulation and it could have a long waiting time and you have access for around 12 days.

Needed for exercises?

Configure run settings: env_run.xml

Setting the length of the simulation:

- STOP_OPTION : nseconds,nsecond,nminutes,nhours,nhour,ndays,nmonths, nyears
- STOP_N: numerical value

    ./xmlchange STOP_OPTION=nmonths,STOP_N=6

Writing restart files in middle of simulation:
Restart files are written end of the simulation by default; But, if you are having a long simulation of 100 years; for safety reason you want to write restart files at some frequency you can set below option

- REST_OPTION: nseconds,nsecond,nminutes,nminute,nhours,nhour,nmonths, nyears
- REST_N: numerical value
- DOUT_S_SAVE_INTERIM_RESTART_FILES: TRUE or FALSE. Set to TRUE if you want to archive all restart files and FALSE if you only want to archive restart files from the end of the simulation

Documentation:
- https://noresm-docs.readthedocs.io/en/noresm2/configurations/experiment_environment.html
- https://noresm-docs.readthedocs.io/en/noresm2/configurations/experiment_environment.html#some-common-configuration-settings

Configure run settings: env_run.xml

Continue a simulation: when you are having WALLCLOCK time limitation on system. For example, you want to have 200 years simulation and WALLCLOCK time limitation is 5 days; you are able to simulate 10 model years/day; to complete 200 model years simulation set RESUBMIT=3, STOP_N to 50 and STOP_OPTION to nyears

- **CONTINUE_RUN** in env_run.xml; TRUE or FALSE.
    - You need all restart files and rpointer.* files in run folder.
    - Please note that CONTINUE_RUN needs to be FALSE first time you submit an experiment.
    - Will automatically be set to TRUE if the job is automatically resubmitted, i.e. if RESUBMIT > 0

- **RESUBMIT** in env_run.xml ; an integer value.
    - will auto resubmit till specified value; you will have total simulation period STOP_N*(RESUBMIT+1)

Documentation:
- https://noresm-docs.readthedocs.io/en/noresm2/configurations/experiment_environment.html
- https://noresm-docs.readthedocs.io/en/noresm2/configurations/experiment_environment.html#some-common-configuration-settings

Configure run settings: env_run.xml

Branch run

In a branch run, all components are initialized using a consistent set of restart files from a previous run. Mostly used for tuning experiments and investigating parameter space

- RUN_TYPE to "branch"
- RUN_REFDIR directory containing reference data
- RUN_REFCASE name of reference case
- RUN_REFDATE Reference date branch run
- GET_REFCASE TRUE else you have to copy data to run folder

Hybrid run

Not as strict as a branch run, all components are initialized but can have reference files from several experiments. Used e.g. for a historical experiment starting from piControl

- RUN_TYPE to "hybrid"
- RUN_REFDIR directory containing reference data
- RUN_REFCASE name of reference case
- RUN_REFDATE Reference date branch run
- GET_REFCASE TRUE else you have to copy data to run folder
- RUN_STARTDATE set the date for the beginning of the simulation

Documentation:
- https://noresm-docs.readthedocs.io/en/noresm2/configurations/experiment_environment.html
- https://noresm-docs.readthedocs.io/en/noresm2/configurations/experiment_environment.html#some-common-configuration-settings

Configure run settings: env_run.xml

Two scripts which you will find helpful (located in the case folder):
1.   xmlquery: provides the information and its value which are set in the *.xml files, e.g. env_run.xml
2.   xmlchange: used to change values/parameters set in the *.xml files, e.g. in env_run.xml

```
$ ./xmlquery --value STOP_OPTION,STOP_N

ndays,5

$ ./xmlchange STOP_OPTION=nyears,STOP_N=1

$ ./xmlquery --value STOP_OPTION

nyears,1
```

If you want to look at the env_run.xml file:

```
$ vi env_run.xml
```

Documentation:
-   https://noresm-docs.readthedocs.io/en/noresm2/configurations/experiment_environment.html
-   https://noresm-docs.readthedocs.io/en/noresm2/configurations/experiment_environment.html#some-common-configuration-settings

Configure run setting: env_batch.xml

You also need to modify **env_batch.xml:**

- XML block for case.run
- env_batch.xml sets the arguments for the batch job commands
- Neet to set JOB_WALLCLOCK_TIME
- XML block for case.st_archive
- case.st_archive is a pending job which moves files from the run directory to the archive directory after a successful simulation.
- also here you need to set JOB_WALLCLOCK_TIME
- you can also modify project for CPU hours if required
  (usually it is set during experiment creation, but you may need to change it)

```
./xmlchange --subgroup case.st_archive JOB_WALLCLOCK_TIME=00:25:00
```

After setting the walltime for the two jobs, you can submit your case:

```
$ ./case.submit
```

Documentation:
https://noresm-docs.readthedocs.io/en/noresm2/configurations/experiment_environment.html#batch-job-environment
